Define a class 'product' with data members pcode, pname and price. Create 3 objects of the class and find the product having the lowest price..

Procedure

```
public class Product{
    String pcode,pname;
    double price;
    public void details(){
        System.out.println("the product name is:" + pname);
        System.out.println("the product code is:" + pcode);
        System.out.println("the product price is:" + price);
    }
    public static void main(String args[]){
        Product obj1=new Product();
        obj1.pcode="p100";
        obj1.pname="cake";
        obj1.price=45.5;
        obj1.details();
        Product obj2=new Product();
        obj2.pcode="p200";
        obj2.pname="juice";
        obj2.price=40;
        obj2.details();
        Product obj3=new Product();
        obj3.pcode="p300";
```

```
obj3.pname="cola";
obj3.price=20 ;
obj3.details();
if((obj1.price<obj2.price)&&(obj1.price<obj3.price)){
    System.out.println("the lowest price product is " + obj1.pname);
}

else if((obj2.price<obj1.price)&&(obj2.price<obj3.price)){
    System.out.println("the lowest price product is " + obj2.pname);
}
else{
    System.out.println("the lowest price product is " + obj3.pname);
}
}
}
```

Output Screenshot

```
C:\Windows\System32\cmd.exe

D:\java_programs>path="C:\Program Files\Java\jdk1.8.0_171\bin"
D:\java_programs>javac Product.java
D:\java_programs>java Product
the product name is:cake
the product code is:p100
the product price is:45.5
the product name is:juice
the product code is:p200
the product price is:40.0
the product name is:cola
the product code is:p300
the product price is:20.0
the lowest price product is cola
```

Program No.: 2**Aim**

Read 2 matrices from the console and perform matrix addition.

Procedure

```
import java.util.*;

class Matrix
{
    public static void main(String args[])
    {
        int row, col,i,j;
        Scanner in = new Scanner(System.in);

        System.out.println("Enter the number of rows");
        row = in.nextInt();

        System.out.println("Enter the number columns");
        col = in.nextInt();

        int mat1[][] = new int[row][col];
        int mat2[][] = new int[row][col];
        int res[][] = new int[row][col];

        System.out.println("Enter the elements of matrix1");

        for ( i= 0 ; i < row ; i++ )
        {

            for ( j= 0 ; j < col ;j++ )
                mat1[i][j] = in.nextInt();

            System.out.println();
        }

        System.out.println("Enter the elements of matrix2");
```

```
for ( i= 0 ; i < row ; i++ )  
{  
  
for ( j= 0 ; j < col ;j++ )  
mat2[i][j] = in.nextInt();  
  
System.out.println();  
}  
  
for ( i= 0 ; i < row ; i++ )  
for ( j= 0 ; j < col ;j++ )  
res[i][j] = mat1[i][j] + mat2[i][j] ;  
  
System.out.println("Sum of matrices:-");  
  
for ( i= 0 ; i < row ; i++ )  
{  
for ( j= 0 ; j < col ;j++ )  
System.out.print(res[i][j]+"\\t");  
System.out.println();  
}  
}  
}
```

Output Screenshot

```
D:\java_programs>javac Matrix.java  
D:\java_programs>java Matrix  
Enter the number of rows  
2  
Enter the number columns  
2  
Enter the elements of matrix1  
1  
2  
3  
4  
Enter the elements of matrix2  
3  
4
